EVENT PILOT

Presented By : C-First

BACKGROUND

- Student Clubs takes a lot of time preparing pre-event documents
- This process can be streamlined to improve the workflow of planning events

PROBLEMS

- The entire pre-event planning process takes time which may cause unmet deadlines
- Certain risks are at times overlooked during this process
- Event sponsors can be difficult to find

SOLUTION

What is EventPilot?

EventPilot is a web-based application that can generate proposals and other pre-event documents from a single prompt

Risks Mitigation

EventPilot can detect risks that may have been missed by the student club such as weather conditions and provide mitigation strategies

Sponsorships

EventPilot is also able to find possible sponsors for the event

Go to "Settings - Data Management - Published Apps" to manage it.
The single public health check passed: **HTTP 200, SQLite available**. No additional live testing.

3. **Slides:** `EventPilot-Pitch.pdf` is attached, along with the existing sample Event Pack. The ten-page deck covers the problem, solution, architecture, workflow and existing screenshot.

Works: event planning, budget/date/weather analysis, execution trace, saved runs, outreach drafts and PDF exports—verified locally before publication.

Missing/manual: LLM activation and visitor Gmail OAuth remain unavailable/unconfigured. Confirm campus approvals, venues, people and funding; review drafts yourself. **No emails were sent.** Submit the links and slides to the hackathon manually.

I kept this to release-only work; I can't see the exact credit charge.

Build and deploy EventPilot event planner

Resuming EventPilot from the integration stage.

The previous local canonical run completed in **4.61 seconds**, proposing **20 March 2027**, with a **RM2,000 budget**, **RM240 contingency**, and a **RM600 unconfirmed funding gap**. These are planning outputs—not confirmed bookings or funding.

Inspection confirmed several remaining blockers: automatic demo-roster seeding, an unsuitable sponsorship email recipient, the missing scheduled-weather update helper, and the incorrect canonical-example button. The pipeline, frontend, and weather specialists are now working on those corrections.

Both QA reviewers— `qa-reviewer` and `qa-security-retry` —failed because the upstream gateway returned no model output. There is no final independent QA approval. This appears recoverable, so review should be retried once the corrected files are stable.

Public deployment, real Gmail drafts, the application-source push, and submission slides remain unfinished. No emails have been sent.

Process

The new queue tests passed. A fresh browser run then exposed a separate SQLite write failure, which I reproduced under concurrent access and repaired by serializing connection lifetimes.

The repaired build now has **76 passing tests and one optional skip**. A fresh canonical browser run passed all nine tabs, exports, reload and mobile checks; the distinct workshop also completed. The ten-page pitch PDF is
